

Editing a placemark

Use these directions to edit your placemark. Right click on your placemark and select "edit placemark." Copy the lines below into the box. By substituting your information for the red text below, you can title your placemark, open an image, describe your placemark, or send the reader to a website for more information.

```
<p>Name of your placemark</p>  
</p>  
<p>text information about your placemark or URL<p>
```

Geotagging Photos with Google Earth and Picasa

Picasa is free software from Google for finding, organizing, editing and sharing photos on your PC. Now, starting with version 2.5, Picasa allows you to use Google Earth to quickly locate (or geotag) the place your photos were taken. You can then create a map in Google Earth to share your photos with your friends. The process is really simple. Once you have your photos in Picasa, simply select a group of photos you want to locate. Then choose the "**Tools ->Geotag with Google Earth**" option. Google Earth will open and a small window with thumbnails of your photos appears. Find the location where the photo was taken in Google Earth using search, or by moving to it with your mouse. Zoom in as close as you need to identify the location. Finally, select the "**Geotag**" button. You can also select a group of photos taken at the same location and choose the "**Geotag All**" option. The location information is stored in a standardized fashion in the photo file itself.

You can then use Picasa to generate a Google Earth file with snapshots of your photo as a map by choosing "**Tools->Geotag->Export to Google Earth**". If you choose "**Tools->Geotag->View in Google Earth**" and your geotagged photos will automatically appear when you look at their respective locations. And if you need a place to store and host your photos online, try Picasa Web Albums.
