

**Prac 3.27**

[A/AC123]

You can combine variables in a boxplot by using the \* notation. For example, `t$ticket*t$sex` is a new factor that contains 4 levels. Make a boxplot of the speed in excess of the speed limit, broken down by both ticket type and sex; there are four different levels of the combined factor. By eye, judge whether there is any evidence for the common belief that women are more likely to get a warning than men are. Describe briefly what you see.
